

Django Assignment: Campus Lost & Found System

☐ Objective

Build a real-life **Campus Lost & Found System** using Django to practice:

- Forms
- Templates
- CRUD
- Authentication
- Middleware
- Django ORM
- Messages

☐ Project Requirements

1. Authentication

Users should be able to:

- Register
- Login
- Logout

Each lost/found report must belong to the logged-in user.

2. Lost & Found Reports

Users can create reports containing:

- Item name
- Type: **Lost** / **Found**
- Category
- Description
- Location
- Date

- Contact information
 - Image (*optional*)
-

3. CRUD

Implement complete CRUD:

Create → Create a report

Read → View all reports + details

Update → Edit own report

Delete → Delete own report

Users **cannot edit/delete another user's report.**

4. Search & Filter

Users should be able to search/filter reports by:

- Item name
- Category
- Lost/Found
- Status

Example:

Search: ID Card

Type: Lost

Category: Documents

[Search]

5. Report Status

Each report should have:

Active,
resolved

The owner can mark their report as **Resolved**.

6. Templates

Use Django template inheritance.

Create:

```
base.html
home.html
reports.html
report_detail.html
report_form.html
login.html
register.html
my_reports.html
```

Use `base.html` for the common navbar/layout.

7. Middleware ☆

Create a custom middleware that logs:

```
User
Request Method
URL/Path
Request Time
```

Example:

```
User: Rahim
Method: POST
Path: /reports/create/
Time: 0.08 seconds
```

The log can be displayed in the terminal.

8. Django Messages

Show messages after actions:

```
Report created successfully!
Report updated successfully!
Report deleted successfully!
```

Report marked as resolved!

☐ Submission Requirements

1. GitHub URL

Submit the public GitHub repository.

The repository should include:

- Source code
 - `requirements.txt`
 - `README.md`
 - Proper project structure
-
